GreenCart Supply Chain - Team Zeta

Case Prompt: GreenCart Quick Commerce Expansion. GreenCart is a mid-sized grocery delivery company operating in three Indian metro cities. The founders are considering an expansion into ten tier-two cities over the next eighteen months. Participants must analyse the market opportunity, evaluate the unit economics of dark stores, identify the main operational risks, and recommend a go-to-market strategy. Answers should address customer acquisition cost, average order value, delivery time commitments, and supplier relationships. Teams must state all assumptions clearly and support every recommendation with quantitative reasoning. The submission should not exceed five pages and must include an executive summary, a market analysis, a financial assessment, and a risk mitigation plan. Cite all external sources using a consistent referencing style. Submissions will be judged on analytical depth, feasibility, clarity of communication, and originality of insight. Late submissions will not be evaluated by the panel.

Metric	Value
Wastage	7%
Mandis	2
Radius	100 km

This report evaluates GreenCart through a supply chain lens. We map every step from farm gate to doorstep and estimate where spoilage and waiting time occur. In tier-two cities, produce often passes through two wholesale mandis, adding a day of delay and roughly seven percent wastage.

Our recommendation is to source vegetables directly from farmer producer organisations within a hundred kilometre radius. Direct procurement shortens the chain, improves freshness scores, and gives GreenCart a story that local customers trust more than national brand advertising.
